# HISTORY

Boart Longyear began manufacturing overburden and construction drilling products in 1989 at its Burghaun facility in Germany to serve the foundation construction market.

Boart Longyear™ overburden and construction tools were quickly recognized by the industry as reliable and well-designed. From the start, our customers appreciated our use of high-quality steels, precise heat treating and thread gauging as well as the development of new tungsten carbides for the drill bit line. Our attention to detail with the overburden and construction drilling tooling product line has made Boart Longyear one of the most respected names in the industry.

Today, Boart Longyear manufactures a broad offering of overburden and construction tooling at our 5000 m<sup>2</sup> (54,000 ft<sup>2</sup>) facility in Eiterfeld, Germany.

The modern ISO9001-certified facility hosts an array of advanced manufacturing capabilities which include CNC (computer numerical control) machining, friction-welding and induction hardening equipment for our rod and casing products as well as computer controlled ovens for assembly of tungsten carbide tipped bits and tools.

## HISTORIC TIMELINE

1989

1989: Boart Longyear begins production of high-quality overburden drilling products in Burghaun, Germany

1996

1996: Introduced jet grouting system for high-pressure injection for foundation construction work

1997

1997: Developed ribbed carbide injection nozzles for jet grouting tools

1998

1998: Released patented Twin Drive™ threaded products

# INNOVATION

Boart Longyear has more than 127 years of experience in the drilling industry and has been an innovator from the start. Shortly after launching the overburden and construction drilling tooling product line, we quickly focused on the development and design of new tungsten materials and geometries specifically suited for overburden drilling applications. These essential materials enable us to produce casing crowns, rotary bits and percussive bits which regularly exceed published service-life specifications.

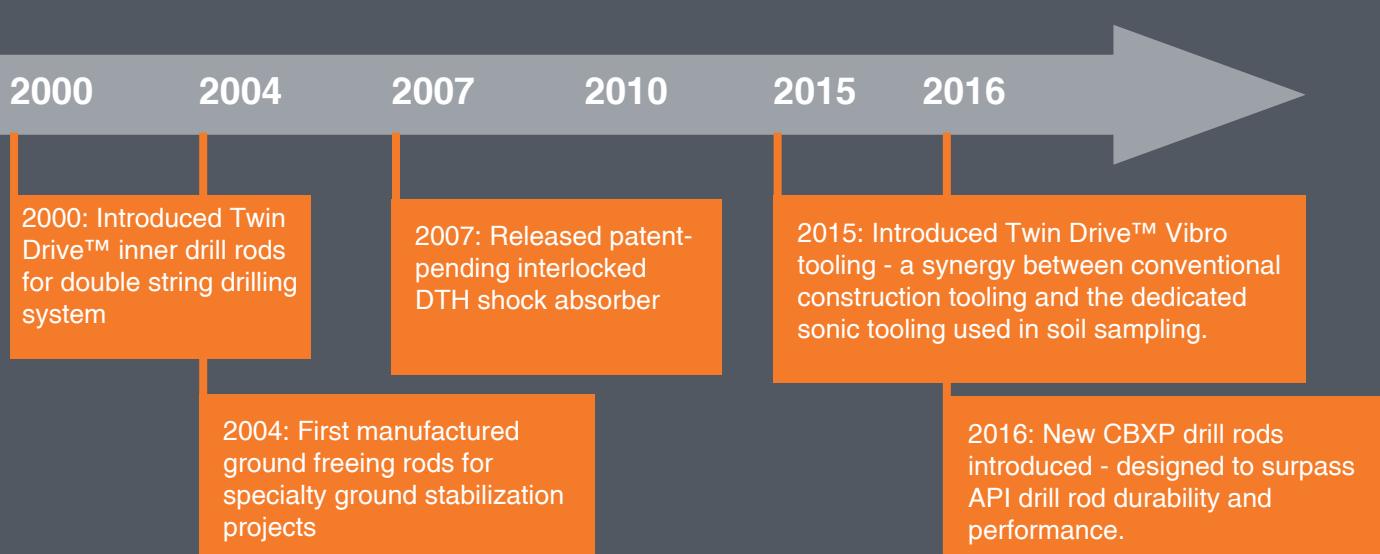

In 1996, we launched our jet grouting system to address the need for high-pressure grout injection tools for foundation construction work. The system includes an innovative automatic valve assembly for integral control of flow direction which accommodates either low-pressure flushing media or high-pressure grout. Additionally, Boart Longyear led the industry in the development of high quality lip seals to replace the conventional O-rings being used in these high-pressure applications.

In 1998, Boart Longyear developed its patented Twin Drive™ thread design for our rotary percussive tools which provided a safe and effective joint solution when using modern high-power hydraulic drifters. The Twin Drive thread offers drillers significantly lower make and break forces on rod joints and up to 40% improvement in casing and drill rod tooling life.

In 1997, Boart Longyear further improved the jet grouting system through the introduction of specialized carbide nozzle designs which provided a 'directed' grout stream and resulted in deeper penetration of the grout into the surrounding soil.

In 2000, we introduced our Twin Drive inner drill rods for dual-string drilling systems as an alternative to T38 and T45 extension drill steels. This provided drillers with a thread designed to handle strong percussive forces while reducing the annulus between casing and the inner rod. The smaller annulus results in better flushing from higher up-hole fluid velocities allowing for higher penetration rates.

*European Patent No. 1117897 in Austria, Italy, Switzerland and the United Kingdom; German patent 19803304.4.*

# INNOVATION

In 2004, Boart Longyear introduced its ground freezing rods for specialty ground stabilization projects. Using our core competencies in steel selection, thread design and seal design, we developed a line of products which dealt extremely well with the cold temperatures faced in ground freezing applications.

In 2007, we developed the patented interlocked shock absorber for the protection of rotary heads during DTH (down-the-hole) drilling. Boart Longyear eliminated the common failure modes in shock absorbers by developing interlock members between the mating parts to absorb the rotary torque.

In 2015, we introduced Twin Drive™ Vibro tooling (a synergy between conventional construction tooling and the dedicated sonic tooling used in soil sampling) for efficient drilling with vibro drill hammers of all kinds.

We continue to drive product innovation through our engineering team in Germany as well as our global engineering organization. Our internal efforts are enhanced by collaboration with universities, raw material suppliers and a variety of technical experts. Our long history of innovation, attention to detail, and our focus on advancing overburden drilling technology enable us to deliver the most effective and efficient tools in the industry.

The CBXP Drill Rod was launched to the market in 2016 as a drill rod design that is used as an inner drill string in double-head drilling applications. The more robust design, compared to the common API (American Petroleum Institute) rod, outperforms API in durability and performance, especially when occasional percussive drilling is involved.

# SINGLE HEAD DRILLING SYSTEMS – HYDRAULIC DRIFTER

## Drive Drilling Systems

Drill head:	Single hydraulic drifter
Flushing:	None or external to casing
Casing:	Rotary/percussive, nipple or friction welded
Bit:	Lost bit left in hole
Typical thread direction:	Left
Diameter offering:	From 89mm (3.5") to 152.4mm (5")

### GROUND CONDITIONS

Gravel, soil, sand, limited boulders and other easily-displaced ground formations

### SYSTEM FEATURES

- Single casing system
- Bit options with non-return valves for use in high water areas

### FLUSHING HEAD (1)

Drive drilling flushing heads allow for the introduction of flushing media into the drive drilling string. Flushing heads are selected to match the shank on the hydraulic drifter as well as the casing diameter and casing thread being utilized.

### ADAPTER (2)

Adapts the different casing sizes and casing thread to the flushing head.

### CASING (3)

Drive drilling systems utilize rotary percussive casing. Casing is either friction welded male/female construction or female/female casing with nipple connections.

### DRIVE SHOE (4)

Drive drilling shoes mount onto the first string of casing and hold the drive drilling bit. They are offered in a variety of designs to engage with the drive drilling bit.

### DRIVE BIT (5)

Drive drilling bits are designed to be lost bits which are left in the hole once the drilling depth is reached. They are available with flushing holes, one-way valves, and tungsten carbide inserts.

# SINGLE HEAD DRILLING SYSTEMS – HYDRAULIC DRIFTER

## Duplex Drilling Systems

Drill head:	Single hydraulic drifter
Flushing:	Air or water within casing
Casing:	Rotary/percussive, nipple or friction welded
Inner drill rod:	Friction welded rod or percussive drill steel
Casing crown:	Tungsten carbide ring bit
Inner bit:	Full face percussive, DTH
Typical thread direction:	Left (percussive), right (DTH)
Diameter offering:	From 89mm (3.5") to 152.4mm (5")

### GROUND CONDITIONS

Gravel, sand, silt, some slate, limestone, limited boulders

### SYSTEM FEATURES

- Dual string drilling system with internal flushing
- Casing can be stopped at any depth while drilling continues with inner rod
- Can be configured for single rotary head with DTH, rotary drag bit, or tri-cone
- Flexible system for a wide range of ground conditions

### FLUSHING HEAD (1)

Allows for the introduction of flushing media into the duplex drilling string as well as an exit point through the ejection bell.

### EJECTION BELL (2)

The ejection bell is part of the flushing head assembly.

### CASING (3)

Duplex drilling systems utilize rotary percussive casing.

### INNER DRILL ROD (4)

The inner drill string of duplex drill systems are either friction welded rotary percussive rods or Twin Drive™ inner drill rods.

### CASING BIT (5)

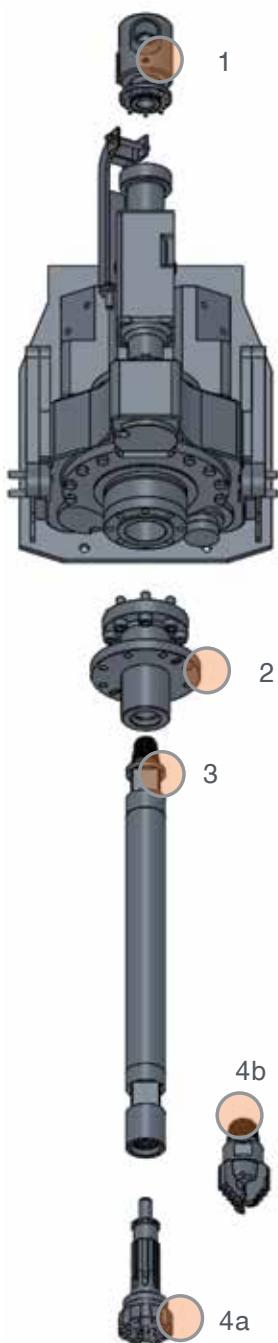

Casing bits for duplex systems are ring bits with tungsten carbide inserts.

### INNER STRING BIT (6)

The inner drill string bit of duplex drilling systems typically utilizes a full face percussive bit, but can also be used with rotary bits or DTH hammers.

# SINGLE HEAD DRILLING SYSTEMS – ROTARY HEAD

## Single Tube System

Drill head:	Rotary
Flushing:	None or external to casing
Casing:	No casing
Bit:	DTH bits / standard rotary bits or tri-cone bits

### GROUND CONDITIONS

- DTH hammer is a potential solution in medium-hard up to harder ground conditions.
- In medium-hard formation, the inner drill string can be arranged with a tri-cone or standard rotary bit.

### SYSTEM FEATURES

- A flushing method for stable medium-hard ground conditions
- Flexibility to deal with many different drilling conditions

### FLUSHING HEAD (1)

Duplex drilling flushing heads allow for the introduction of flushing media to the drill string. The heads are selected to match the flange or threads of the rotary head. The flushing head is typically mounted on the rear side of the rotary head when using a hollow drive shaft.

### HEAD ADAPTER FLANGE (2)

The head adapter flange provides a sealed connection to the rotary head. Options are available to fit a wide range of rotary heads. The adapter flange connects to the drill string by a threaded connection and provides a conduit for flushing media.

### SINGLE DRILL ROD (3)

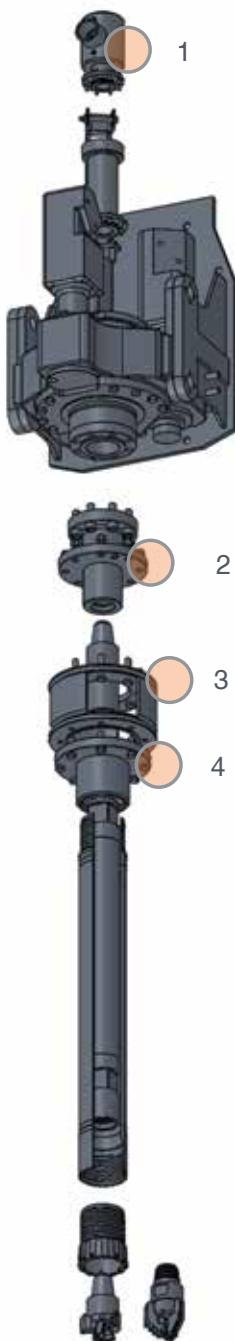

Drill rods typically use friction welded API male/female connections. When flushing only, other rod/thread options are available to minimize flow restrictions.

### INNER STRING BIT (4)

If using a DTH hammer, various types of bits may be selected (4a). If the inner drill string is applied without DTH, then standard rotary (drag) bits (4b) or tri-cone bits can be used.

# SINGLE HEAD DRILLING SYSTEMS – ROTARY HEAD

## Duplex Tube System

Drill Head:	Rotary
Flushing:	Air or water within casing
Casing:	Rotary casing friction welded male/female
Inner drill rod:	Mainly API or CBXP thread in male/female
Inner bit:	Standard rotary bits or DTH
Casing crown:	Ring bits with tungsten carbide inserts.
Typical thread direction:	Right hand (DTH)

### GROUND CONDITIONS

- DTH hammer is a potential solution in medium-hard to hard ground conditions.

### SYSTEM FEATURES

- A controlled flushing method to prevent contact of the flushing with the bore hole wall
- Ability to stop driving the casing and continue drilling to depth with only the inner string

### FLUSHING HEAD (1)

Duplex drilling flushing heads allow for the introduction of flushing media to the drill string. The heads are selected to match the flange or threads of the rotary head.

### HEAD ADAPTER FLANGE (2)

The head adapter flange is attached by a sealed flange connection to the drive shaft of the rotary head. This adapter flange is designed to connect the ejection bell by a flange connection and the balancing rod for the inner drill string by a thread connection. The adapter flange has a center flushing hole so the flushing medium can pass through to the inner drill string.

### EJECTION BELL (3)

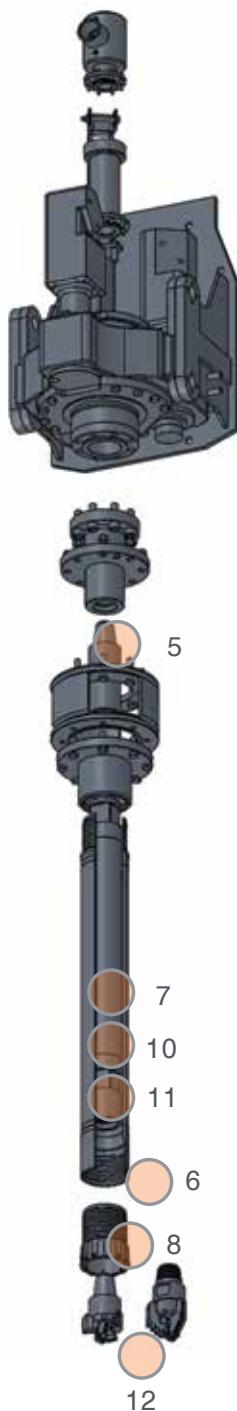

The ejection bell has a top flange connection, which fits to the adapter flange. The lower flange connection is designed to fit the casing flange. The ejection bell has a large diameter to collect and eject the flushing media.

### CASING ADAPTER FLANGE (4)

The casing adapter flange is screwed on the ejection bell and connects to the outer casing which is available in various sizes.

# SINGLE HEAD DRILLING SYSTEMS – ROTARY HEAD

## Duplex Tube System

### BALANCING ROD (5)

The balancing rod is threaded to the head adapter flange. It balances the length of the ejection bell and casing adapter of the inner drill string and is available in various lengths. The position of the inner bit can be adjusted as needed (advanced placement or retracted position of inner bit relative to the casing bit position).

### CASING (6)

Duplex drilling systems utilize a rotary casing. Casing is friction welded with male/female thread design.

### INNER DRILL ROD (7)

The inner drill strings of a duplex rotary drilling system are friction welded. Friction welded API male/female rods are commonly used for the inner string of a duplex rotary drilling system.

### CASING BIT (8)

Ring bits with tungsten carbide inserts are used for duplex drilling system casing. The type and configuration of the carbide inserts is dependent on the ground conditions.

### DTH HAMMER (10)

DTH hammers are available in different sizes and types.

### DTH BALANCING ROD (11)

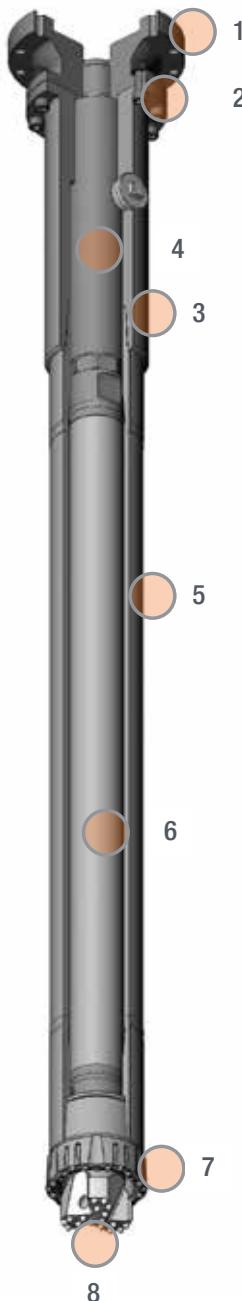

The balancing rod adjusts the length of the DTH Hammer to the casing drill string rod length.

### INNER DRILL BIT (12)

The inner drill bits are available as DTH bits and different types of rotary bits.

# VIBRO DRILLING

## TDV Twin Drive™ Vibro Systems

Drill head:	Vibro drill heads
Flushing Medium:	Air, water or mud
Casing:	Twin Drive Vibro percussive, friction welded
Inner drill rod:	Twin Drive Vibro percussive, friction welded
Casing crown:	Ring bit with tungsten carbide inserts
Inner bit:	Full face bit with tungsten carbide inserts
Drilling direction:	Left-hand or right-hand
Diameter offering:	89mm (3.5") to 152.4mm (6")

### GROUND CONDITIONS

Gravel, sand, silt, some slate, limestone, limited boulders, clay and hard rock

### SYSTEM FEATURES

- Dual string system with internal flushing or single drill string
- Stop casing at any depth while drilling continues with inner rod
- Higher drilling speed and depth compared to standard percussive
- Less wear through lower torque requirements
- Flexible system for a wide range of ground conditions

### FLUSHING HEAD (1)

The flushing head allows for the introduction of flushing media into the duplex vibro drilling string and exit through the ejection bell. The torque bracket is attached to the flushing head.

### FLANGE (2)

RHV2400: The flange connects the casing and inner rod to the vibro drill head.

RHV1500: The flange includes the flushing body of the flushing head and is the connection of ejection bell and balancing rod to the vibro drill head.

### EJECTION BELL (3)

The ejection bell is part of the flushing head assembly and includes the holes for the ejection of drilling fluids/chips.

### BALANCING ROD (4)

The balancing rod equalizes the length of the ejection bell for the position of inner rod / inner drill bit relative to the casing.

### CASING (5)

Duplex drilling systems utilize vibro percussive friction welded casing.

### INNER DRILL ROD (6)

The inner drill string of vibro duplex drill systems are friction welded rotary percussive rods.

### CASING BIT (7)

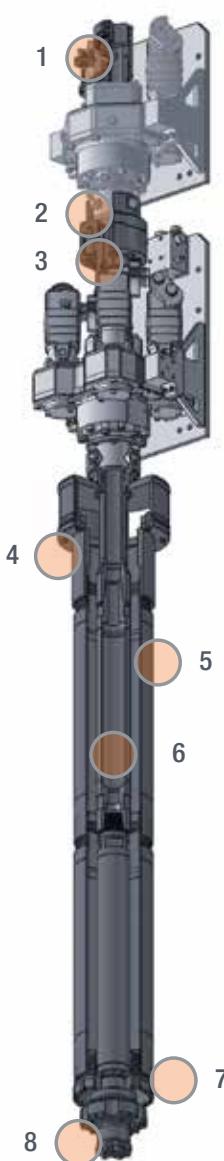

Casing bits for vibro duplex systems are ring bits with tungsten carbide inserts.

### INNER STRING BIT (8)

The inner drill string bit of vibro duplex drilling systems typically utilizes a full face percussive bit.

# DOUBLE HEAD DRILLING SYSTEMS

## Double Head Rotary–Rotary

Drill head:	Dual rotary heads
Flushing:	Air, water, mud within casing
Casing:	Rotary, friction welded
Inner drill rod:	API, CBXP, auger drill rods
Casing crown:	Tungsten carbide ring bit
Inner bit:	DTH, rotary drag bit, tri-cone
Typical thread direction:	Left (casing), right (inner rod)
Diameter offering:	108 mm to 177.8 mm (casing diameter)

### GROUND CONDITIONS

All ground conditions

### SYSTEM FEATURES

- Dual-string drilling system with internal flushing
- Independent control of casing and inner string
- Control of inner bit relative to casing crown
- Low hole deviation compared to other drilling methods
- Excellent choice for deeper drilling requirements
- Highly flexible drilling system for varied ground conditions
- Can be sealed against pressurized water

## DOUBLE HEAD ROTARY–ROTARY

### FLUSHING HEAD (1)

The flushing head in rotary-rotary drilling systems is mounted above the upper drilling head. It is designed to fit the specific drill head in the system.

### SHOCK ABSORBER (2)

The shock absorber protects the rotary head from damage due to vibrations from a DTH used with the inner drill string.

### BALANCE ROD (3)

The balance rod provides the link between the top drill head and the inner drill string.

### CASING FLANGE AND EJECTION BELL (4)

The casing flange connects the casing to the lower rotary head and provides an exit point for the flushing medium through the ejection bell.

### CASING (5)

Dual rotary drilling systems utilize male/female friction welded double-start rotary percussive casing. Rotary percussive single and triple-start casing can also be used.

### INNER DRILL ROD (6)

The inner drill string on dual rotary drill systems are typically API drill rods.

### CASING BIT (7)

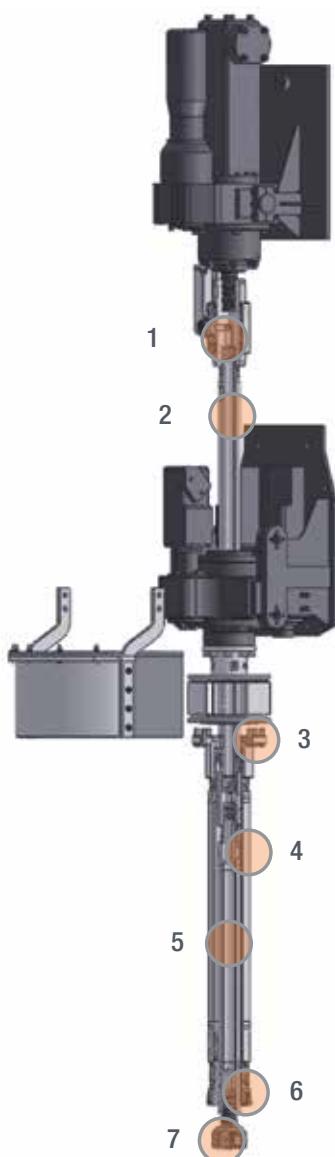

Casing bits for dual rotary systems are ring bits with tungsten carbide inserts.

### INNER STRING BIT (8)

Typically a DTH hammer is used on the inner drill string of dual rotary systems. Rotary bits can also be used.

# DOUBLE HEAD DRILLING SYSTEMS

## Double Head Rotary–Percussive Overview

Drill head:

Rotary head (casing) and hydraulic drifter (inner string)

Flushing:

Air, water, mud within casing

Casing:

Rotary, friction welded

Inner drill rod:

Friction welded rod or percussive drill steel

Casing crown:

Tungsten carbide ring bit

Inner bit:

Full face percussive or cross blades

Typical thread direction: Right (casing), left (inner rod)

Diameter offering: 114.3 mm to 177.8 mm (casing diameter)

### GROUND CONDITIONS

All ground conditions

### SYSTEM FEATURES

- Dual string drilling system with internal flushing
- Independent control of casing and inner string
- Control of inner bit relative to casing crown
- Low hole deviation compared to other drilling methods
- Highly flexible drilling system for varied ground conditions
- Can be sealed against pressurized water
- Faster than rotary/rotary drilling

## DOUBLE HEAD ROTARY-PERCUSIVE OVERVIEW

### FLUSHING HEAD (1)

The flushing head in rotary percussive systems is mounted below the hydraulic drifter.

### BALANCE ROD (2)

The balance rod provides the link between the drifter with flushing head and the inner drill string.

### CASING FLANGE AND EJECTION BELL (3)

The casing flange connects the casing to the lower rotary head and provides an exit point for the flushing medium through the ejection bell.

### CASING (4)

Male/female friction welded double-start rotary percussive casing. Rotary percussive single and triple-start casing can also be used.

### INNER DRILL ROD (5)

Friction welded rotary percussive rods or Twin Drive™ inner drill rods.

### CASING BIT (6)

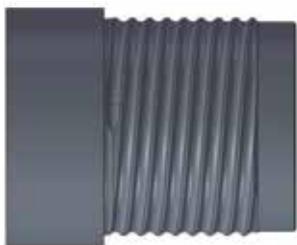

Ring bits with tungsten carbide inserts.

### INNER STRING BIT (7)

Typically utilizes a full face percussive bit with tungsten carbide inserts.

# CASING AND ROD THREADS

Boart Longyear offers a variety of thread types designed for specific drilling applications.

## CYLINDRICAL

Cylindrical threads are characterized by parallel walls which means the casing or rod must be completely unscrewed prior to separating the joint.

Cylindrical threads are the most common threads utilized for reusable overburden rotary percussive casing and inner rods. For rotary percussive casing, all cylindrical threads are single-start up to 88.9 mm and triple-start for larger diameters.

All standard rotary overburden casing is manufactured by Boart Longyear with a double-start cylindrical thread.

## CONICAL

Conical threads are similar in thread form and appearance to cylindrical threads except there is a 0.5° – 1.0° angle resulting in a slight conical shape. It requires fewer turns to open and a separate conical thread joint. Conical threads are available only on rotary percussive casing.

## TWIN DRIVE™

Our patented Twin Drive™ threads have been developed for rotary percussive casings and inner rods to handle the increased percussive power of hydraulic drifters. A typical cylindrical or conical thread form has a stress concentration at the base of the male thread. The Twin Drive thread form distributes the load along the full length resulting in lower stresses at any given point in the thread. It takes much less torque to make and break the rod joint and provides up to 40% additional life in hard ground conditions.

Twin Drive threads are available on all rotary percussive casing and rods. Boart Longyear uses the Twin Drive thread on all critical threading applications including modular flushing heads, Twin Drive inner rod systems and non-percussive applications such as geothermal and jet grouting tools.

Twin Drive threads reduce stress, are easier to uncouple, have a higher loading capacity, are leak resistant and offer reduced susceptibility to corrosion.

# THREAD SPECIFICATIONS

## THREAD DIRECTION

Casing and inner drill rods are offered in both left and right-hand threads. The direction of rotation required is determined by the drill system and drilling heads being utilized.

### Typical Direction of Rotation

DRILLING SYSTEM	OUTER CASING	INNER ROD
Drive Drilling	Left-Hand	
Duplex Drilling	Left-Hand	Left-Hand
Double Head Rotary-Rotary	Left-Hand	Right-Hand
Double Head Rotary-Percussive	Right-Hand	Left-Hand
Jet Grouting	Right-Hand	

## THREAD STARTS

The number of thread starts on a given thread varies by the size of the tooling, the application of the tooling, and the type of thread utilized.

### Thread Starts – Rotary Percussive Rod/Casing

CASING DIAMETER	THREAD TYPE	INNER ROD
51 mm-88.9 mm	Conical/Cylindrical	Single-Start
51 mm-88.9 mm	Twin Drive™	Multi-Start
101.6 mm-177.8 mm	Conical/Cylindrical	Triple-Start
101.6 mm-177.8 mm	Twin Drive™	Multi-Start

### Thread Starts – Rotary Casing

CASING DIAMETER	THREAD TYPE	NO OF STARTS
114.3 mm-177.8 mm	Cylindrical	Double-Start

### Thread Length

## THREAD LENGTH

The thread length of overburden casing varies by casing diameter and thread type.

CASING DIAMETER	ROTARY PERCUSSIVE CONICAL	ROTARY PERCUSSIVE CYLINDRICAL	ROTARY CYLINDRICAL	TWIN DRIVE™
51 mm-63.5 mm	65 mm	65 mm		Varies
76.1 mm-88.9 mm	75 mm	75 mm		
101.6 mm-152.4 mm	100 mm	125 mm	110 mm	
177.8 mm	Varies	Varies	Varies	

# CASING AND ROD TYPES

## Rotary Percussive Casing

Friction welded rotary percussive casings are available in standard sizes with left-hand threads and spanner flats.

- Designed for use in drive drilling and duplex drilling systems
- Engineered to withstand the percussive forces from hydraulic drifters
- Reinforced wall thickness at thread ends to handle heavy percussive drilling
- Superior percussive power transmission due to Twin Drive™ threads
- Highest quality quench and tempered thread ends

# CASING AND ROD TYPES

## Rotary Percussive Rod - Twin Drive™ Rod

Twin Drive™ drill rods are designed for use on the inner drill string of duplex and rotary percussive drilling systems. Twin Drive rods are an alternative to the T38 and T45 extension rods used in these systems. Up-hole flushing velocity may be reduced when using T38 and T45 rods due to the large annulus. Twin Drive systems are designed to minimize the area between the inner rod and casing so that up-hole flushing velocity is optimized. The larger inner diameter of the inner rod allows a higher medium flow without creating back-pressure, in addition to improved flushing. Twin Drive rods increase flushing capacity. Twin Drive drill rods (depending on size) can have an inner diameter up to 100% larger than standard percussive T45 and T51 drill rods.

Twin Drive drill rods are comprised of special hardened / nitrided alloy steel and special steel mid-bodies. Twin Drive rods have two percussion surfaces compared to the single surface typically found on standard percussive drill rods. This dual percussive surface area transmits the percussion force through the drill rod at an optimum rate while increasing the strength of the drill rod.

# CASING AND ROD TYPES

## Rotary Casing

All Boart Longyear™ rotary casing is intended for re-usable casing applications where it is removed after grouting. Rotary casings are designed for rotational drilling without percussion.

All sizes are available with right-hand or left-hand thread configurations. Rotary casings have a continuous flush inner diameter throughout the entire length of the casing.

Rotary casing is also available with the Twin Drive™ thread. Sizes up to 406 mm diameter are available upon request.

### FRICTION WELDED ROTARY CASING

Friction welded casing has quenched and tempered pin and box ends constructed of high tensile strength steel. The threaded ends are friction welded onto a mid-body manufactured from an economical mid-grade steel. Casings are friction welded up to 152.4 mm. Larger casings are manually welded.

- Economical choice for re-usable casing
- Quench and tempered high grade rod ends for numerous make and break cycles without damage or galling of threads
- Friction welded for a superior welded connection between threaded joints and mid-body

### DIRECT THREAD ROTARY CASING

Direct thread casing has the pin and box threads machined directly into an annealed mid-grade steel.

- Annealed steel construction for superior tensile strength and resistance to abrasive wear during use

# CASING AND ROD TYPES

## API Drill Rod

API DTH drill rods are designed for use in rotary and rotary DTH applications. These are commonly used as single rotary rods or as the inner drill string on double head rotary-roto applications.

The rod ends of API rods are constructed of high-tensile strength quench and tempered steel. The rod ends are gas nitrided to provide additional life to the drill string. Rod ends are friction welded onto mid grade mid-body material.

API rods are manufactured in a variety of lengths and wall thickness and include internal flush designs for additional flushing capacity. Boart Longyear can manufacture alternative rod lengths and spanner flats upon request.

- Long-life thread designs utilizing high strength steel
- Friction welding for a superior welded connection between threaded joints and midbody
- Customized length and flats as required

# CASING AND ROD TYPES

## CBXP Drill Rods

CBXP drill rods are primarily intended for use in rotary and rotary DTH drilling applications but are also commonly used as the inner drill string on double head rotary-rotary applications or in a single head rotary duplex application. CBXP may also be used for smaller percussive drilling applications.

The rod ends of our CBXP rods are constructed of high tensile strength quench and tempered steel and are gas nitrided to provide additional life. Rod ends are friction welded onto mid grade mid-body material

CBXP rods are manufactured in a variety of lengths and wall thickness. Boart Longyear can manufacture alternative rod lengths and spanner flats upon request.

- More robust thread compared to API
- Higher torque capacity compared to API
- Transition from percussive force
- Larger flushing capacity compared to API
- Long-life thread designs with high strength steel
- Superior welded connection between threaded joints and midbody
- Customized length and flats as required

# BIT DESIGNS

## Casing Bits

Boart Longyear offers a large selection of casing bits to perform in a wide variety of ground conditions. Casing bits are designed for rotary percussive or rotation only drilling based on the tungsten carbide inserts utilized as well as the geometry of the bit. Customized tools for unique drilling applications are also available upon request.

### CONSTRUCTION

Casing bit bodies are constructed of high strength quenched and tempered steel. The high-quality tungsten carbide inserts are induction brazed into the steel bodies ensuring a secure fit without overheating issues associated with flame brazing. Strict machining control of the carbide seats prevents premature loss of carbide inserts.

### GAUGE PROTECTION

Tungsten carbide gauge protection on casing bits prevents excessive wear on the outer diameter of the bit in abrasive ground conditions. Additionally, in unconsolidated conditions where the ground is caving in on the drill string, gauge protection assists in freeing the bit and casing by providing another cutting surface.

### SHRINK FIT CARBIDES

When required, Boart Longyear offers shrink fit installation of all hemispherical, ballistic, and two-step tungsten carbide inserts instead of the standard induction brazing. This very precise construction method is often utilized when drilling in extremely hard ground conditions and provides both increased button retention and longer overall life.

### ADVANTAGES

- Computer controlled induction brazing of tungsten carbide inserts for superior process control and overheating prevention, common with flame brazing
- High-grade body construction with quenched and tempered steels
- Optional tungsten carbide gauge protection available for unconsolidated grounds and increased bit life in abrasive conditions
- Specialized designs for unique drilling situations such as drilling through reinforced concrete and drilling without inner bits

# BIT DESIGNS

## Casing Bit Designs

### HEMISPERICAL BUTTON TYPE

Hemispherical buttons are designed for percussive drilling in hard ground conditions, but can be used universally for all ground conditions when percussive drilling.

### BALLISTIC BUTTON TYPE

Ballistic buttons on a casing bit works for percussive as well as some rotary drilling. Ballistic buttons offer more aggressive penetration rates in medium-hard ground conditions when percussive drilling.

### BLADED TYPE

A bladed type casing bit is designed for percussive drilling in medium to hard ground conditions.

### TWO-STEP BUTTON WITH GAUGE PROTECTION

Designed for rotary percussive drilling, the two-step button is a balance between the more aggressive ballistic tungsten carbide and the hemispherical button used in hard ground conditions. This bit performs well in a wide range of harder ground conditions.

# BIT DESIGNS

## Casing Bit Designs

### SCRAPING BUTTON TYPE

The scraping button bit is designed as a good alternative for both rotary and percussive drilling. The tungsten carbide insert geometry allows for some percussive drilling while also providing an efficient cutting action for rotary drilling.

### SCRAPING BUTTON WITH GAUGE PROTECTION

The scraping button type drill bit is available with gauge protection to maintain outer diameter and assists in freeing casing in unconsolidated grounds.

### SCALPING BUTTONS WITH WEAR PROTECTION FOR REINFORCED CONCRETE

Designed for drilling through reinforced concrete. The additional carbides in this bit provide additional cutting performance to get through common reinforced construction materials. This bit should only be used for rotary drilling.

### SCALPING BUTTON WITH GAUGE PROTECTION

This bit is designed exclusively for rotary drilling. The tungsten carbide design allows for efficient removal of material while in rotation. This bit can be purchased with either a variety of rotary percussive threads or double-start cylindrical threads specifically for use with rotary casing.

# BIT DESIGNS

## Casing Bit Designs

### W-TYPE WITHOUT WEAR PROTECTION

Arrangement of small and larger ballistic carbides allow for superior percussive drilling performance when the straightness of the hole is critical. The larger center buttons minimize hole deviation while performing the primary cutting action. The outer buttons perform the secondary cutting providing efficient penetration rates.

### W-TYPE WITH WEAR PROTECTION

### EXTRA LOBE BIT

Lobe and eccentric designed bits allow for drilling without the use of an inner drill string. The additional carbide cutting area replaces the need for an inner drill bit. The concave or convex placement of the lobe simulates the placement of the normal inner drill string bit (advanced or following) to the casing bit.

CONCAVE

CONVEX

PLANAR

# BIT DESIGNS

## Casing Bit Designs

ECCENTRIC BIT

BIT WITH CUTTING BLADE

Cutting blade bits are designed for rotational drilling without an inner drill string. The cutting blade is knocked off the bit and left in the hole during anchor and grout installation.

On request, the cutting blade can be supplied with additional hard facing and additional carbide cutting inserts.

# BIT DESIGNS

## Inner String Bits

Boart Longyear offers a wide selection of bits for the inner drill string of overburden drilling systems for a variety of ground conditions that drillers face every day. Inner drill string bits are primarily designed for rotary percussive drilling but in some situations performs well in mixed drilling or pure rotary drilling. In addition to standard designs, Boart Longyear offers several specialty designs for unique drilling situations and can also design custom bits upon request.

### CONSTRUCTION

The bit bodies are constructed of high strength quenched and tempered steel. The high-quality tungsten carbide inserts are induction brazed into the steel bodies ensuring a permanent fit without overheating issues associated with flame brazing. Strict machining control of the carbide seats prevent premature loss of carbide inserts.

### GAUGE PROTECTION

Boart Longyear offers tungsten carbide gauge protection on some designs. Gauge protection will prevent excessive wear on the outer diameter of the bit in abrasive grounds.

### SHRINK FIT CARBIDES

Shrink fitting installation of all hemispherical, ballistic and two-step tungsten carbide inserts instead of the standard induction brazing is available. This very precise construction method is often utilized when drilling in extremely hard ground conditions giving the bits enhanced performance.

### ADVANTAGES

- Computer controlled inductive brazing of tungsten carbide inserts for superior process control and overheating prevention, common with flame brazing
- High grade body construction with quenched and tempered steels
- Optional gauge wear protection tungsten carbides available

# BIT DESIGNS

## Inner String Bits Design

### HEMISPERICAL BUTTON TYPE

Hemispherical buttons are designed for percussive drilling in medium to hard ground conditions. Button bits typically have faster penetration rates and longer service life than bladed style inner drill bits.

### BLADED CROSS TYPE

Bladed cross type bits are designed for percussive drilling in medium to hard ground conditions. Bladed bits typically drill straighter than button style bits. In certain rock conditions cross bits tend to produce a spiraled 5-sided hole.

### BLADE X-TYPE

Designed for percussive drilling in medium to hard ground conditions, X-type bits typically drill straighter than button style bits. Additionally X-type bits will tend to drill round holes in all rock conditions.

### BALLISTIC BUTTON TYPE

Designed for percussive drilling as well as limited rotary drilling, ballistic buttons offer more aggressive penetration rates than hemispherical buttons in medium-hard ground conditions.

# BIT DESIGNS

## Inner String Bits Design

### TWO-STEP BUTTON TYPE

Designed for rotary percussive drilling, the two-step button is a balance between the more aggressive ballistic button and the hemispherical button used in harder grounds. This bit can perform well in a larger range of harder ground conditions. Gauge protection inserts are standard for improved life in abrasive ground conditions.

### BALLISTIC BUTTON THREE-WING TYPE

The three-wing type bits are available with both ballistic and scraping button carbide styles. The carbide buttons allow for penetration through harder ground conditions with percussive drilling. The carbide tipped cutting wings provide efficient penetration when rotary drilling.

### SCRAPING BUTTON ROTARY BIT – THREE-WING TYPE

The three-wing rotary bit with scraping buttons provides efficient penetration in medium-hard ground using rotary drilling. The bit may also be used when temporarily using percussive drilling. In addition, three-wing bits provide highly effective flushing.

# BIT DESIGNS

## Drive Drilling, Bit Designs

### DRIVE DRILLING

Drive bits are used by single percussive drilling when the bit will remain in the hole. Suitable for drilling through gravel, boulders, sand, soil and other easily displaced ground formations. Drive bits are produced with carbide inserts to suit the application.

Available with standard flushing holes or non-return valves when drilling in back pressure conditions.

### DRIVE SHOES

The drive shoe is mounted to the first string of casing and holds the drive drilling bit. You can engage the drive drilling bit with flat collar, twist lock (bayonet), rectangular, etc. drive shoe designs.

# BIT DESIGNS

## Tungsten Carbide Inserts

### HEMISPERICAL BUTTON

- For hard rock
- Dedicated for rotary percussive drilling
- Low abrasive wear

### BALLISTIC BUTTON

- For medium-hard rock (mudstone, marl, sandstone) as well as loose rock
- Dedicated for rotary percussive drilling

### TWO-STEP BUTTON

- For medium-hard rock (mudstone, marl, sandstone) as well as loose rock
- Best suited for rotary percussive drilling

### BLADED INSERT

- For medium-hard rock (mudstone, marl, sandstone) as well as loose rock
- Dedicated for rotary drilling with temporary percussion

### SCALPING INSERT

- For concrete as well as for loose rock and soft geological formations
- Best suited for rotary drilling

### SCRAPING INSERT

- For loose rock as well as for soft geological formations (mudstone, marl)
- Best suited for rotary drilling with temporary percussion

### SCRAPING INSERT THREE-FACE

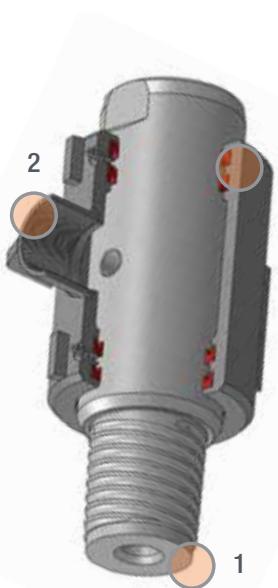

- For loose rock as well as for soft geological formations (mudstone, marl)
- Dedicated for rotary drilling with temporary percussion

NOTE: Use appropriate eye protection, masks and ventilation when grinding drilling bits. Grinding wheels and tungsten carbide inserts contain: Tungsten Carbide; Cobalt; Tantalum; Chromium; Nickel; Aluminum and Silicon. Grinding tungsten carbide inserts releases particles containing these elements that can irritate skin, eye, nose, throat and can result in lung damage.

# FLUSHING HEADS – SINGLE HEAD

## Drive Drilling Flushing Head

Drive drilling flushing heads allow for the introduction of flushing media into the drive drilling string. Flushing heads are selected to match the shank on the hydraulic drifter as well as the casing diameter and casing thread being utilized.

3  
Drive drilling flushing heads for alternate casing sizes and hydraulic drifter shanks are available upon request.

### FLUSHING BODY (1)

The flushing body has a female thread to match with the hydraulic drifter shank and a male thread to match the casing in use.

### FLUSHING RING AND SEALS (2 & 3)

The flushing ring is held stationary by the mounting bracket fixed to the drifter while the flushing body rotates. The flushing ring is the connection point for the flushing hose and has upper and lower lip seals to contain the flushing media.

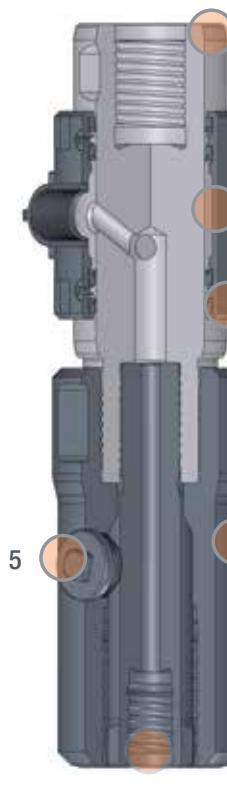

### MOUNTING BRACKET

The mounting bracket, which is matched to the hydraulic drifter, keeps the flushing ring stationary on the flushing body.

# FLUSHING HEADS – SINGLE HEAD

## Duplex Drilling Flushing Head

Duplex drilling flushing heads allow for the introduction of flushing media into the drill string as well as an exit point through the flushing bell.

Duplex flushing heads are modular in design, to keep the same flushing body and flushing ring but allowing for change of the balance rod and ejection bell for different sizes of casing and inner rods being utilized.

### FLUSHING BODY (1)

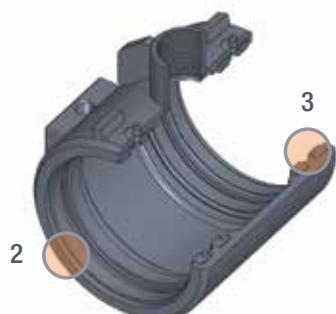

One end of the flushing body has a female thread to match with the hydraulic drifter shank on the drill. The other end of the flushing body has a female thread to match the balance rod as well as a male thread to match the flushing bell.

### FLUSHING RING AND SEALS (2 & 3)

The flushing ring is held stationary by the mounting bracket fixed to the drifter while the flushing body rotates. The flushing ring is the connection point for the flushing hose and has upper and lower lip seals (3) to contain the flushing media.

### FLUSHING BELL (4)

The flushing bell has either a female Twin Drive™ thread or a female rope thread to mate with the flushing body and a female thread to match the casing being used in the drill string. Flushing media exits the drill string through the flushing bell.

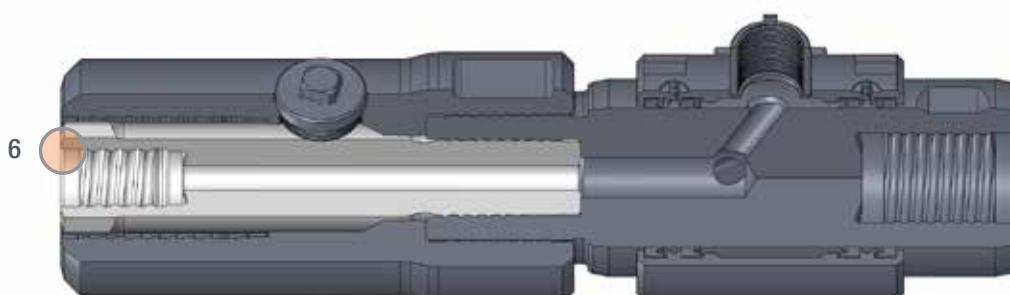

### FLUSHING PLUG (5)

A threaded plug is provided with the flushing bell to block off the return flushing flow and force circulation via the outside of the casing through the annulus to the surface.

### BALANCE ROD (6)

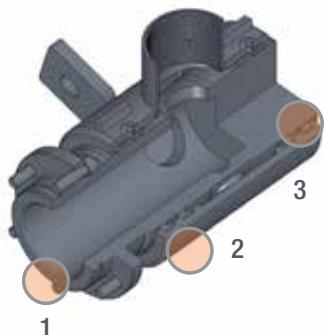

The balance rod provides the connection between the flushing body and the inner drill string. The male end of the balance rod uses the Twin Drive thread form to match with the flushing body. The female end is matched to the inner drill string being utilized.

# FLUSHING HEADS – DOUBLE HEAD

## Double Head Drilling Flushing Head

### ROTARY-ROTARY

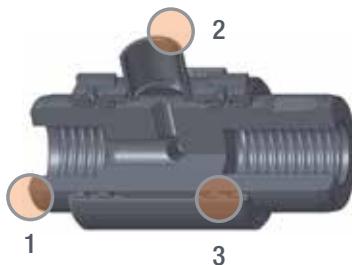

Double head drilling systems have a flushing system to introduce flushing media into the inner drill string at the upper rotary head or drifter. Flushing media exits the drilling system at the ejection bell mounted below the lower rotary head. These systems are designed for the specific drill heads on a drill, the head mounting, and the sizes of the tools being used for the job.

### FLUSHING BODY (1)

The flushing body of the flushing head on a dual head drilling system mounts either on the top rotary head (on a rotary-rotary system) or below the drifter (on a rotary-percussive system). In both cases, the flushing body is matched to the specific rotary head or drifter of the drilling system.

### ROTARY-PERCUSSIVE

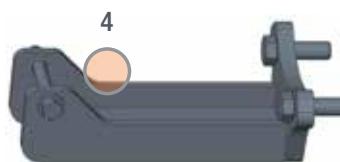

### FLUSHING RING AND SEALS (2 & 3)

The flushing ring is held stationary by the mounting bracket fixed to the drifter while the flushing body rotates. The flushing ring is the connection point for the flushing hose and has upper and lower lip seals to contain the flushing media.

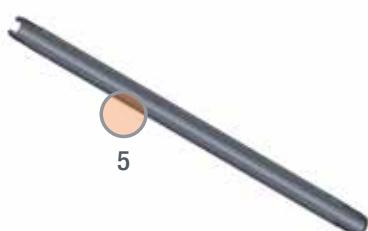

### MOUNTING BRACKET (4)

The mounting bracket, which is matched to the hydraulic drifter, keeps the flushing ring stationary on the flushing body.

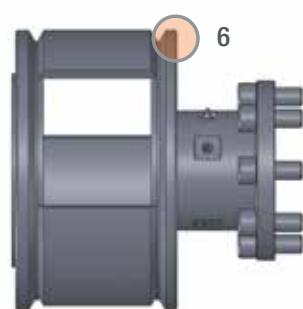

### BALANCE ROD (5)

The balance rod in a double-head drilling system is used to connect the inner drill string of the system to the upper rotary head or drifter. The length and thread on the rod is specific to the drilling system being used. Length of the balance rod must be specified at the time of order.

### EJECTION BELL (6)

The ejection bell in dual head drill systems is mounted directly under the lower rotary head. The ejection bell design is unique to the rotary head it is used on. Flushing media and cuttings exit the drilling system through the large opening in the ejection bell.

### CASING FLANGE (7)

The casing flange is the connection point for the outer casing used in the drilling system. It is mounted directly to the ejection bell and has a thread to match the casing being used.

# JET GROUTING SYSTEMS OVERVIEW

Overview	40
Single Tube System	40
Double Tube System	41
Triple Tube System	42

# OVERVIEW

## APPLICATION

Jet grouting or high-pressure Injection is a ground stabilization technique as well as a sealing method used in soil conditions ranging from loose sediment up to soft rock structures.

In the jet grouting process, a cement suspension is injected at pressures of 100-600 bar (1,450-8,700 psi) through the jet grouting tooling and into the soil in the drilled hole. The cement suspension mixes with the surrounding soil as the jet grouting tool string is slowly rotated and retracted from the hole. The result is a subsurface grout column.

Jet grouting is performed with either single, double, or triple tube jet grouting systems based on the ground conditions, the grout injection, air and/or water for the ground jetting and mixing.

## SINGLE TUBE SYSTEM

### FLUSHING HEAD (1)

Flushing heads for single tube jet grouting systems provide the connection point to the drill string for both the flushing media during drilling and the high-pressure grout during grout injection. Heads are mounted to a flushing head carrier which travels up the mast extension on the jet grouting rig.

### ROD (2)

Single tube jet grouting rods provide the drill string for drill rotation and flushing as well as the path to the nozzles for the high-pressure grout injection. Rod ends are constructed of high strength nitrided steel and friction welded to an annealed mid-body. Rods come with special seals between rods which resist damage from abrasive grouts and multiple cycles of making and breaking rod joints.

### VALVE FASTENER (MONITOR) (3)

The valve fastener (also called a monitor) mounts between the drill rod string and the drill bit. The valve fastener contains the injection nozzles as well as the automatic valve.

### AUTOMATIC VALVE (4)

The automatic valve is located within the valve fastener and controls the flow of both low-pressure flushing fluids and high-pressure grouting media. During drilling operations, the spring loaded automatic valve allows for flushing fluids to pass out through the drill bit. When high-pressure grout is introduced into the drill string the automatic valve will close directing the jet grouting media out through the injection nozzles in the valve fastener. The pressure can be adjusted in front of the drilling start when the valve closes for jet grouting.

### INJECTION NOZZLE (5)

The grout injection nozzles mounted in the valve fastener are the exit point for the high-pressure grout into the grouting zone. Injection nozzles are constructed with a tungsten carbide body with a threaded steel base. The nozzles are available with various sizes of a standard round injection orifice or a ribbed injection orifice. The ribbed orifice creates an injection with less turbulence by a more compact jet.

### ROTARY BIT (6)

The rotary bit for a single tube jet grouting system mounts below the valve fastener. Designed for rotary drilling only in overburden, rotary bits come in a variety of winged bit designs with tungsten carbide inserts and flushing ports.

# DOUBLE TUBE SYSTEM

## FLUSHING HEAD (1)

Flushing heads for double tube jet grouting systems provide the connection point to the drill string for the flushing media during drilling as well as the high-pressure grout and air during grout injection. Flushing heads are mounted to a flushing head carrier which allows the head to move up the mast extension on the rig.

## ROD (2)

Double tube jet grouting rods provide the drill string for drill rotation and flushing as well as the path to the nozzles for the high-pressure grout injection. Rod ends are constructed of high strength nitrided steel and friction welded to an annealed mid-body. Inner tubes in the dual tube systems are secured inside the outer rod utilizing a circlip or wire fuse connection. Rods come with special seals between rods which resist damage from abrasive grouts and multiple cycles of making and breaking rod joints.

## VALVE FASTENER (MONITOR) (3)

The valve fastener (also called a monitor) mounts between the drill rod string and the drill bit. The valve fastener contains the injection nozzles as well as the automatic valve. The valve fastener channels the medium from the inner drill string and outer rod to their associated nozzles.

## AUTOMATIC VALVE (4)

The automatic valve is located within the valve fastener and controls the flow of both low-pressure flushing fluids and high-pressure grouting media. During the drilling operation the spring-loaded automatic valve allows for flushing fluids to pass out through the drill bit. When high-pressure grout is introduced into the drill string the automatic valve will close directing the jet grouting media and air out through the injection nozzles in the valve fastener. The pressure can be adjusted in front of the drilling start when the valve closes for jet grouting.

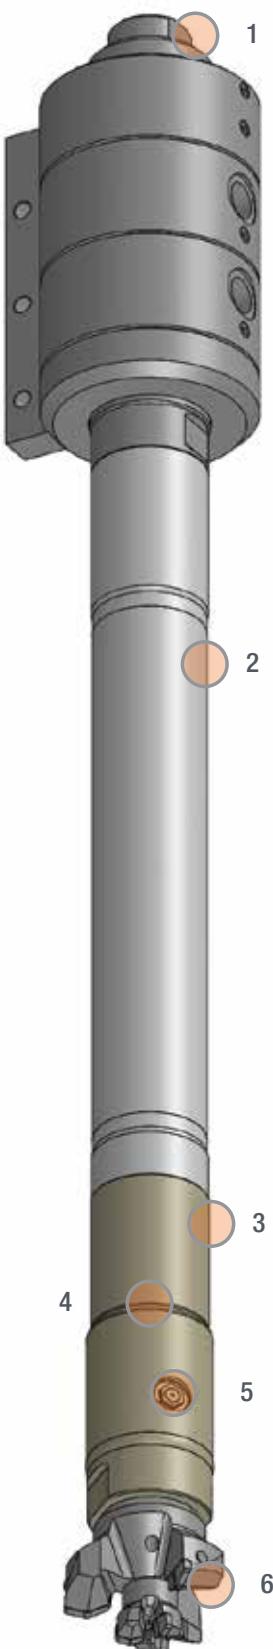

## INJECTION NOZZLE (5)

The grout injection nozzles mounted in the valve fastener are the exit point for the high-pressure grout into the grouting zone. Injection nozzles are constructed with a tungsten carbide body with a threaded steel base. The nozzles are available with various sizes of a standard round injection orifice or a ribbed injection orifice. The ribbed orifice creates an injection with less turbulence from a more compact jet.

## ROTARY BIT (6)

The rotary bit for a double tube jet grouting system mounts below the valve fastener. They are designed for rotary drilling only in overburden. They come in a variety of winged bit designs with tungsten carbide inserts and flushing ports.

# TRIPLE TUBE SYSTEM

## FLUSHING HEAD (1)

Flushing heads for triple tube jet grouting systems provide the connection point to the drill string for the flushing media during drilling. Flushing heads also manage the grout and separate water jet and air supply during grout injection. The inner rod connection is designed for high-pressure injection with 400-600 bar.

Flushing, grout, water and air for the shrouded high-pressure jet stream pass through separate channels within the system. The grout injection supply goes separately through another channel. Flushing heads are mounted to a flushing head carrier which allows the head to move up the mast extension on the rig.

## ROD (2)

Triple tube jet grouting rods provide three different channels for drilling, jet-grouting and the air-curtain for the grouting. Rod ends are constructed of high strength nitrided steel and friction-welded to an annealed mid-body. Inner and middle tubes in the triple tube systems are secured inside the outer or middle rod utilizing a circlip or wire fuse connection. Rods come with special seals between rods which resist damage from abrasive grouts and multiple cycles of making and breaking rod joints.

## VALVE FASTENER (MONITOR) (3)

The valve fastener (also called a monitor) mounts between the drill rod string and the drill bit. The valve fastener contains the injection nozzles as well as the automatic valve. It includes the air shrouded water jet nozzle and a separate grout nozzle. The valve fastener provides the medium from the inner drill string, middle drill string and outer rod through channels to their associated nozzles.

## AUTOMATIC VALVE (4)

The automatic valve is located within the valve fastener and controls the flow of both low-pressure flushing fluids and high-pressure grouting media. During the drilling operation the spring-loaded automatic valve allows for flushing fluids to pass out through the drill bit. When high-pressure water is introduced into the drill string the automatic valve will close directing the jet grouting media and air/water out through the injection nozzles in the valve fastener. The pressure, when the valve should close for jet grouting, can be adjusted in front of the drilling start.

## INJECTION NOZZLE (5)

The grout injection nozzles mounted in the valve fastener are the exit point for the pressure grout into the grouting zone and the air shrouded high-pressure water jet for the ground cuttings and mix. Injection nozzles are constructed with a tungsten carbide body with a threaded steel base. The nozzles are available with various sizes of a standard round injection orifice or a ribbed injection orifice. The ribbed orifice creates an injection with less turbulence by incorporating a more compact jet.

## ROTARY BIT (6)

The rotary bit for a triple tube jet grouting system mounts below the valve fastener. They are designed for rotary drilling only in overburden. They come in a variety of winged bit designs with tungsten carbide inserts and flushing ports.

# GROUND FREEZING SYSTEM OVERVIEW

Ground Freezing System

44

# GROUND FREEZING SYSTEM

Ground freezing is a temporary ground support technique that is used extensively for groundwater control and ground stabilization in underground construction and deep excavation projects. The process involves circulating refrigerated liquids through a series of subsurface pipes to freeze the ground creating a solid barrier that prevents water intrusion and provides structural support for excavation.

Boart Longyear manufactures ground freezing drill rods that are installed for refrigerated liquid circulation. Freezing rod applications have some unique challenges that are not found in typical foundation construction drilling applications. Boart Longyear has conducted extensive development processes to ensure the freezing rods we provide incorporate our knowledge of construction drilling as well as unique technologies that are special to the ground freezing application.

Each ground freezing project has its own distinctive challenges which make the tooling requirements unique. Boart Longyear can design the tooling package to meet your specific needs.

## PRODUCT RANGE

- Freezing rods in various diameters and lengths up to 6 m.
- Driving rods with various bit configurations including carbide tips and flushing holes with check valves
- Rotary drive flanges
- Rotary percussive freeze rod systems upon request

## KEY FEATURES

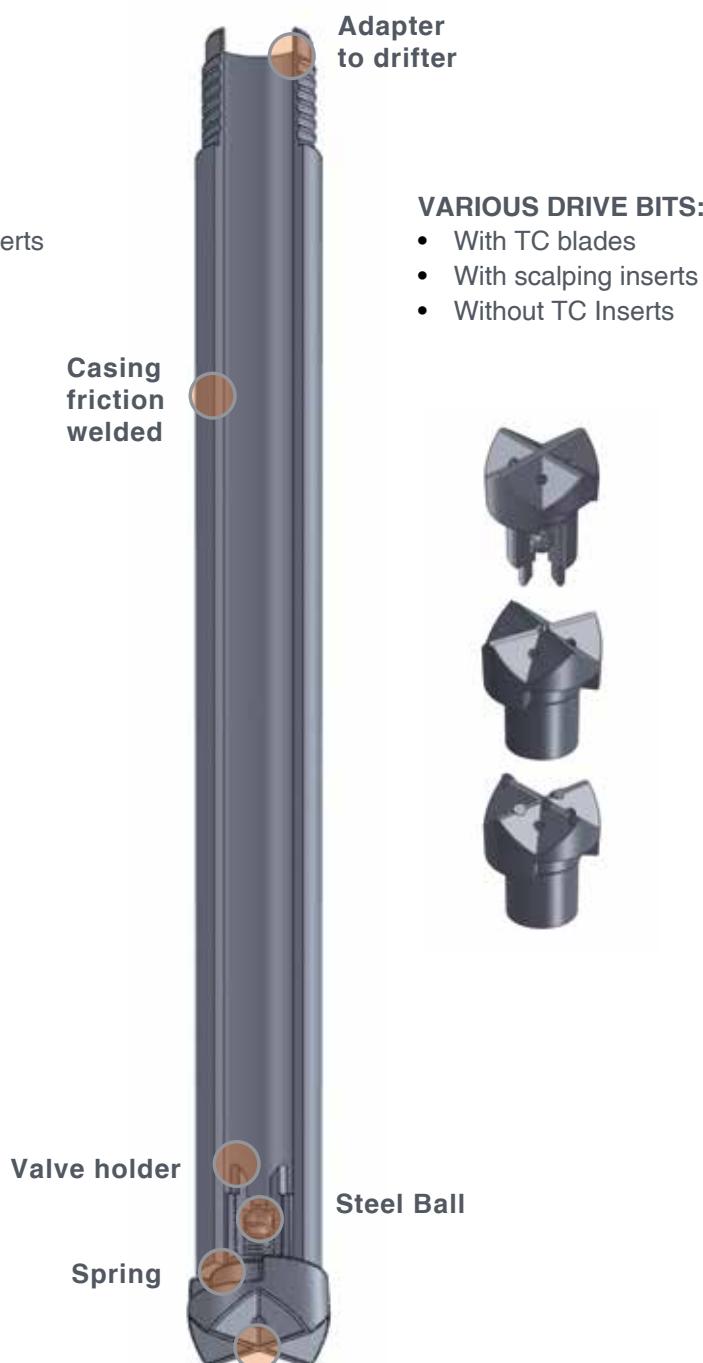

- Specially selected steel for the strength required for drilling while also remaining stable when subjected to extreme low temperatures
- Specially designed threads that maintain a tight seal in the drill string, preventing leakage of freezing fluids into the surrounding ground
- Custom designed rod seals that can withstand low temperatures as well as tolerate various greases commonly found on drilling sites
- Various configurations of driving points incorporating carbide inserts, flushing holes with check valves and percussive bits
- Economical rod designs keeping total project cost to a minimum

# WARRANTY

# WARRANTY

## Limited Warranty.

(a) Consumables. Boart Longyear warrants for a period of one (1) year after the date of shipment of the consumable products manufactured by it, or the performance of related services, under the Contract, that such consumable products are free from defects in materials and workmanship and such services are performed in a professional and workmanlike manner; provided, however, with respect to consumable products purchased through an authorized Boart Longyear distributor, the warranty period shall commence on the date of purchase by the end-user.

(b) Capital Equipment. Boart Longyear warrants that the capital equipment manufactured by it is free from defects in materials and workmanship for a period equal to the lesser of (i) one (1) year after the date of shipment, or (ii) the initial 1,000 operating hours. Boart Longyear warrants for a period of six (6) months after the performance of related services that such services are performed in a professional and workmanlike manner.

(c) General Terms. Boart Longyear further warrants that, to the extent applicable, as of the date of shipment or performance, all goods manufactured by it and services performed shall conform to the written specifications agreed between the parties. THIS IS BOART LONGYEAR'S ONLY WARRANTY. BOART LONGYEAR MAKES NO OTHER WARRANTY, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. As a condition to Boart Longyear's warranty obligations, Purchaser must: (i) contact Boart Longyear and request authorization to return any goods claimed to be defective promptly upon Purchaser's discovery of the alleged defect, (ii) upon receipt of an approved authorization code from Boart Longyear, return any goods claimed to be defective under the foregoing warranty, at Purchaser's expense, to the facility designated by Boart Longyear, and (iii) with respect to consumable products purchased through an authorized Boart Longyear distributor, the party making the warranty claim must also deliver to Boart Longyear reasonable evidence of the date of purchase. Boart Longyear shall perform its examination

of the goods so returned by Purchaser and shall report the results of its examination to Purchaser within thirty (30) days following its receipt of such goods from Purchaser, or, if longer time is required to complete such examination, within such time as would be required through the exercise of reasonable diligence. As a further condition to Boart Longyear's obligations hereunder for breach of warranty, Purchaser shall offer its reasonable cooperation and assist Boart Longyear in the course of Boart Longyear's review of any warranty claim. If requested by Purchaser, Boart Longyear will promptly repair or replace, at Boart Longyear's expense, goods that are confirmed to be non-conforming as a result of Boart Longyear's examination and according to Boart Longyear's warranty as set forth herein. All removal and installation of goods shall be at Purchaser's expense; provided, however, Boart Longyear will reimburse the Customer for an amount equal to the reasonable expenses incurred by the Customer and attributable to the removal and shipment of any defective goods. Boart Longyear reserves the right to reimburse Purchaser for an amount equal to the purchase price of any defective goods in lieu of providing repaired or replacement goods. Anything contained herein to the contrary notwithstanding, in no event shall Boart Longyear be liable for breach of warranty or otherwise in any manner whatsoever for: (i) normal wear and tear; (ii) corrosion, abrasion or erosion; (iii) any goods, components, parts, software or services which, following delivery or performance by Boart Longyear, has been subjected to accident, abuse, misapplication, modification, improper repair, alteration, improper installation or maintenance, neglect, or excessive operating conditions; (iv) defects resulting from Purchaser's specifications or designs or those of its contractors or subcontractors other than Boart Longyear; (v) defects associated with consumable parts or materials, the lifetime of which is shorter than the warranty period set forth in this Section; (vi) defects associated with Purchaser's specifications or designs or those of its contractors or subcontractors other than Boart Longyear; (vii) defects resulting from the manufacture, distribution, promotion or sale of Purchaser's own products; or (viii) accessories

# WARRANTY

of any kind used by the Purchaser which are not manufactured by or approved by Boart Longyear.

(d) Sourced Goods. If the defective parts or components are not manufactured by Boart Longyear, the guarantee of the manufacturer of those defective parts or components is accepted by the Purchaser and is the only guarantee given to the Purchaser in respect of the defective parts or components. Boart Longyear agrees to assign to the Purchaser on request made by the Purchaser the benefit of any warranty or entitlement to the defective parts or components that the manufacturer has granted to Boart Longyear under any contract or by implication or operation of law to the extent that the benefit of any warranty or entitlement is assignable.

(e) Limitation on Liability. Except as provided for herein, in no event will Boart Longyear be liable for any indirect, incidental, special, consequential, punitive or similar damages including, but not limited to, lost profits, loss of data or business interruption losses. In no event will the total, aggregate liability of Boart Longyear under the Contract exceed the value of the Contract under which liability is claimed. The liability limitations shall apply even if Boart Longyear has been notified of the possibility or likelihood of such damages occurring and regardless of the form of action, whether in contract, negligence, strict liability, tort, products liability or otherwise. The parties agree that these limits of liability shall survive and continue in full force and effect despite any termination or expiration of any Contract. Any action by Purchaser against Boart Longyear must be commenced within one year after the cause of action has accrued. No employee or agent of Boart Longyear is authorized to make any warranty other than that which is specifically set forth herein. The provisions in any specification, brochure or chart issued by Boart Longyear are descriptive only and are not warranties.
